

List of data

contains a list of panels and ea
a list of fields and for each field
events

each panel contains
list of options &

How to render Events to Components

-By creating an object and defining each service id and refering it's service class.

- From filed event list we add host listener and gee event name (click , change,...) from evnet type and get service from (field service id) and assign the event from method name that exist in service and in event name property

```
graph TD; A[ ] --> B["in each component it calls the assigned Method function that exist in parent component to render events"]; B --> C["after each component rendered and assgin events for the component the component and change in any other component by changing the value of form control value that exist in field - service"]
```

in each component it calls the assigned Method function that exist in parent component to render events

after each component rendered and assgin events for the component the component and change in any other component by changing the value of form control value that exist in field - service
